

Ping Error

Explain proper scenario for following ping errors ?

① Destination host unreachable

- * The source device cannot reach the destination network/host
- * It usually caused by wrong IP/subnet configuration, No route to the destination, Gateway/route problem, Destination host/network is down.

② Request timed out

It means the ping request was sent, but no ICMP Echo reply was received within the timeout period. The problem reason are destination device is down, Firewall is blocking ICMP, Packet loss/congestion and Network Connectivity Problem.

③ Reply from some ip destination host unreachable

* The IP shown in the reply is telling you that it cannot reach the requested destination.

* Usually that IP is your gateway/route or another intermediate device.

* It means the problem is somewhere after that device such as missing route, ARP failure, or unreachable next hop network.

④ TTL expired

TTL - Time to Live is reduced by 1 every time a packet passes through a router.

If TTL reaches 0 before reaching the destination, the router drops the packet and sends TTL expires.

The common cause is routing loop, incorrect routing configuration, Destination is too many hops away for the configured TTL.
